

How First Responder Scheduling Software *Saves Lives*

Avoid Injuries

Many first responders suffer from heart attacks and other injuries due to stress and overexertion. Scheduling software shows when staff members have worked too many days in a row per union or department rules. Departments can use the software to make sure that responders take breaks between shifts and overtime is allocated fairly.

Respond Immediately

When the appropriate staff are scheduled to work, dispatched apparatus can respond to incidents right away. No scrambling to fill last minute breaches. Response times are low and constituents can quickly get help.

Track Certifications

Scheduling software tracks the expiration dates of current licenses and certifications. This way, crews always have the personnel with the exact skill sets they need at the incident, such as EMR certification.

Fill Breaches in Advance

Don't let vacancies lead to loss of life down the line. Scheduling software flags any breaches in upcoming shifts with daily, weekly, and monthly views, so administrators can quickly fix shortages and avoid under-staffing.

Well-staffed departments are better able to respond to incidents quickly, help their communities, and save lives.

Scheduling software also helps public safety departments cut costs and increase efficiency. Check out our RollCall first responder staff scheduling product at www.adashisystems.com/rollcall
